CR[!D] Versioning & Conversion

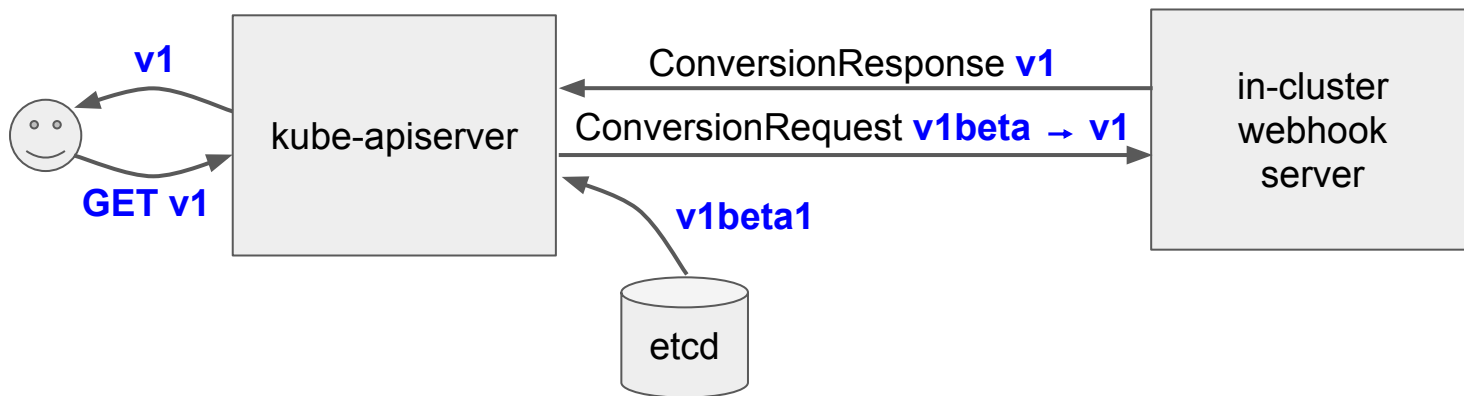

deep dive

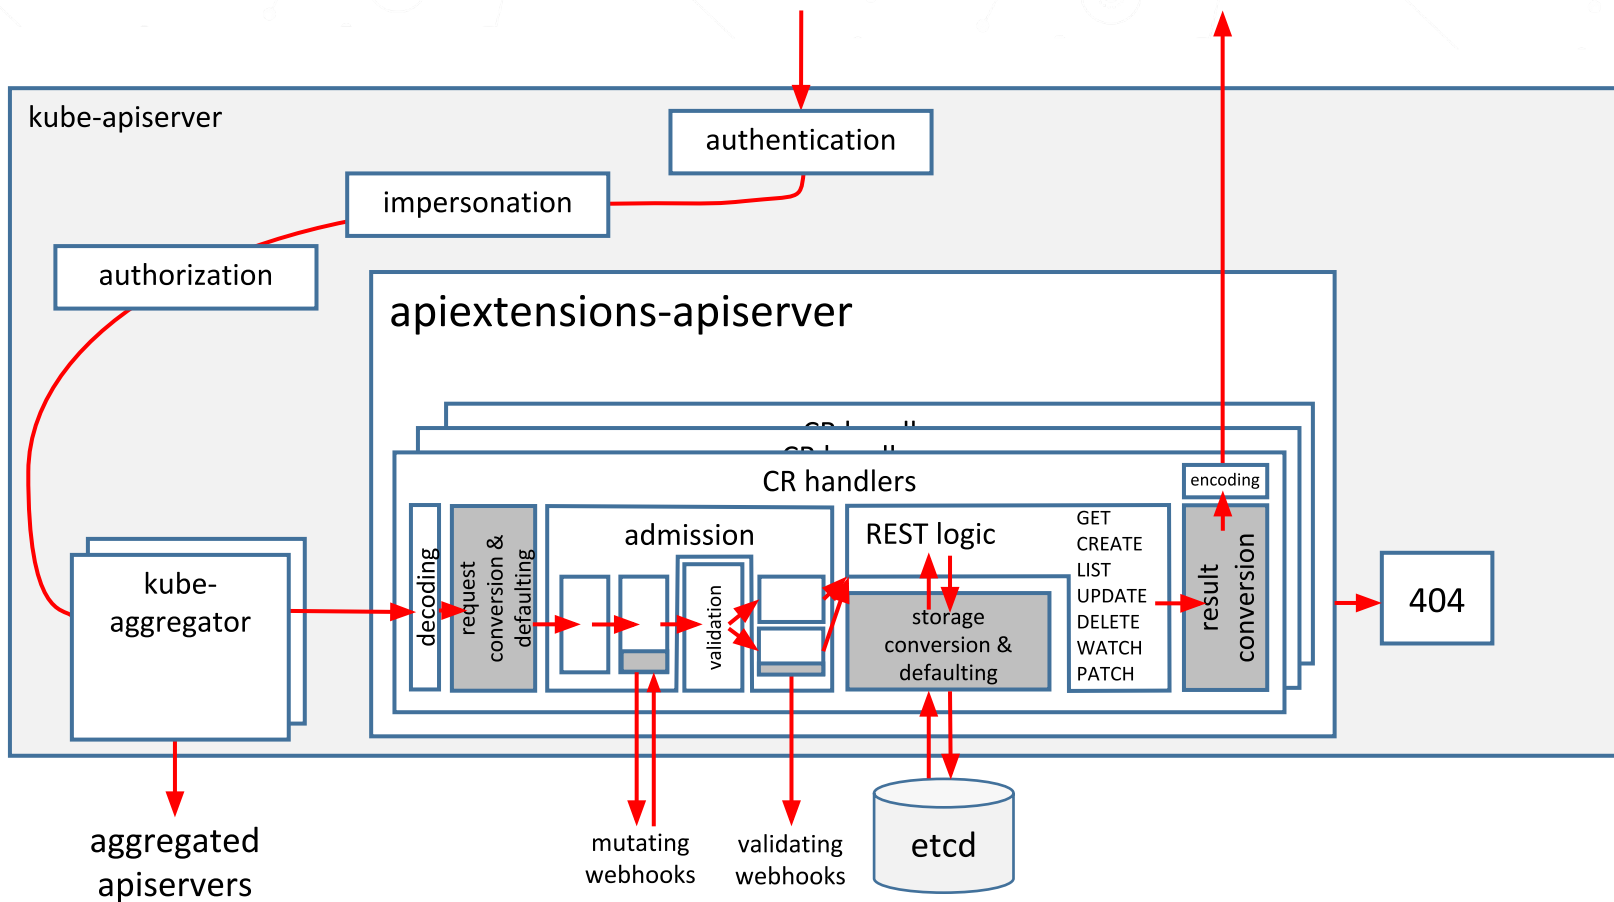

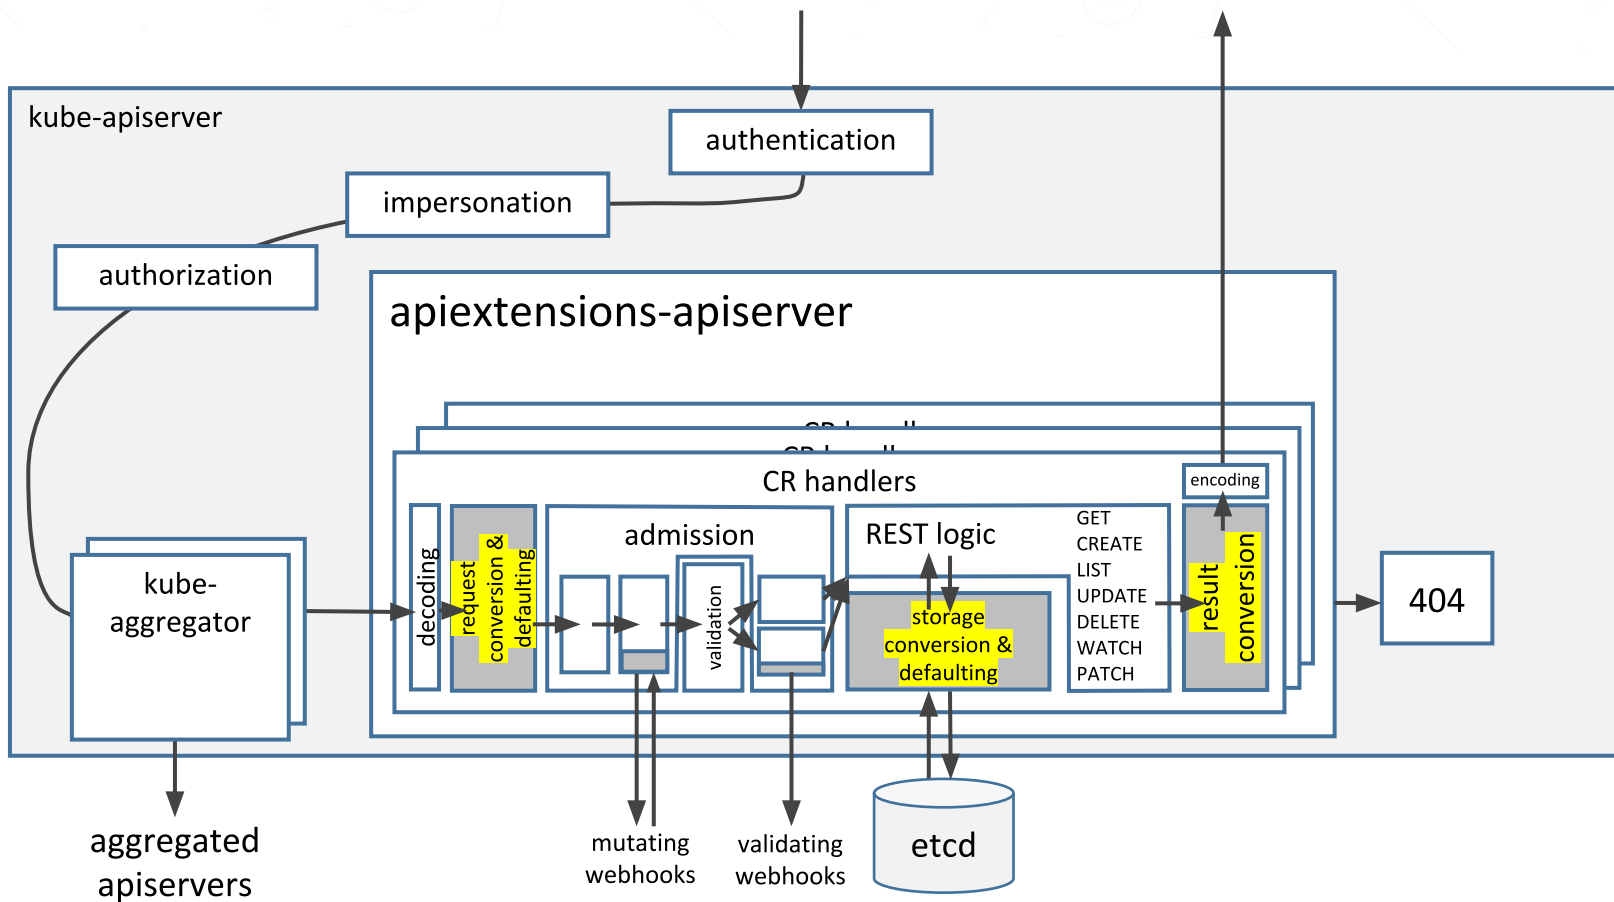

CR Conversion

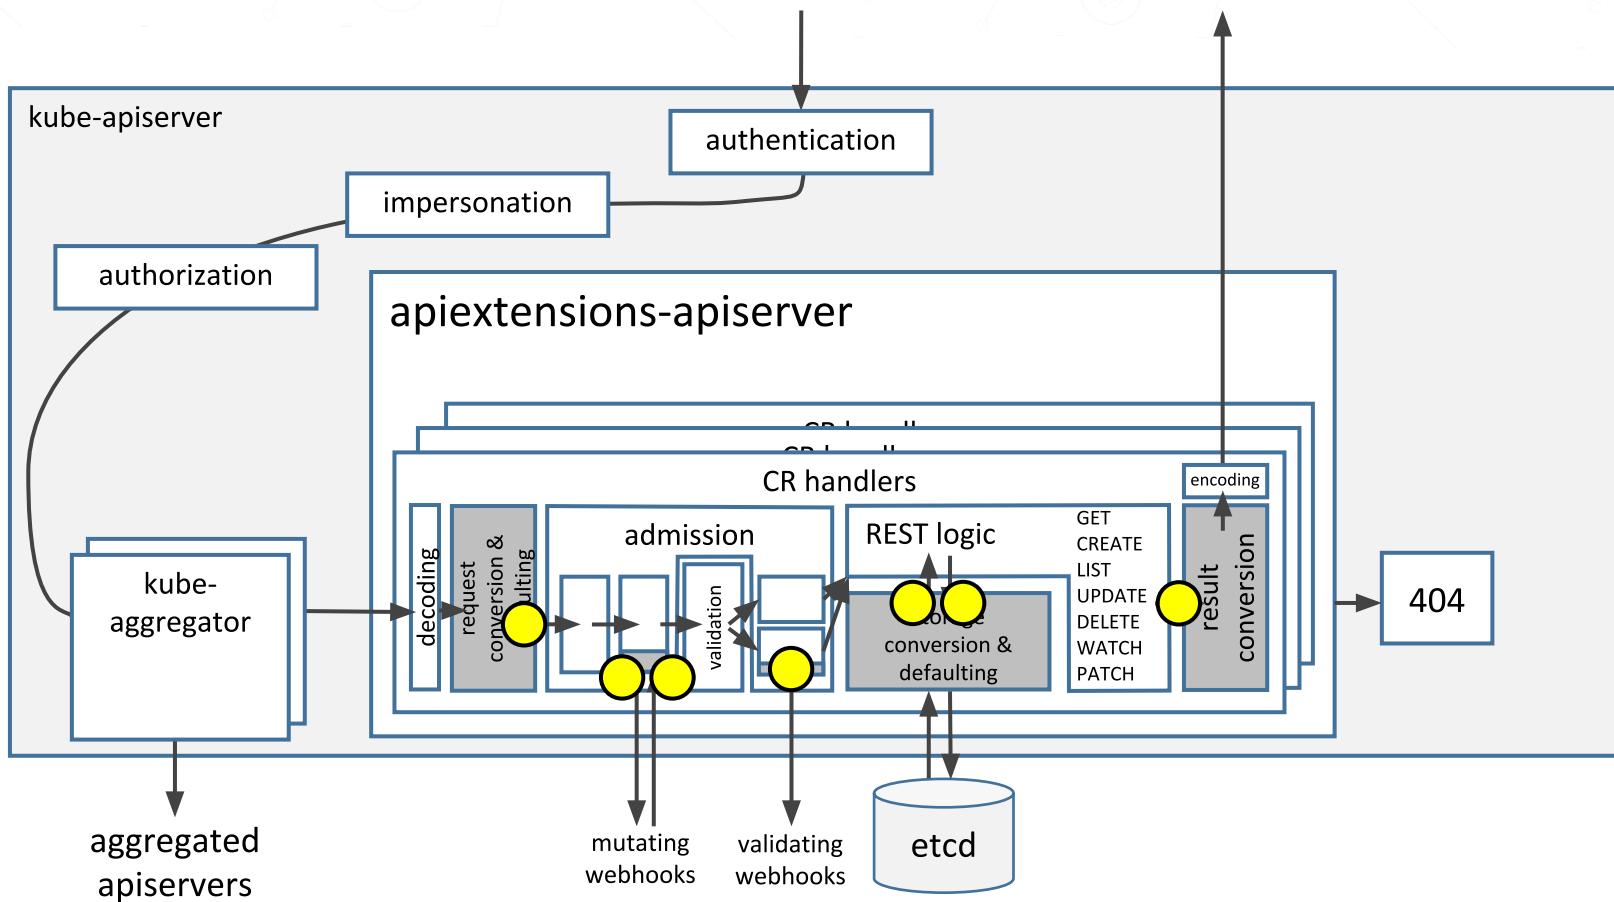

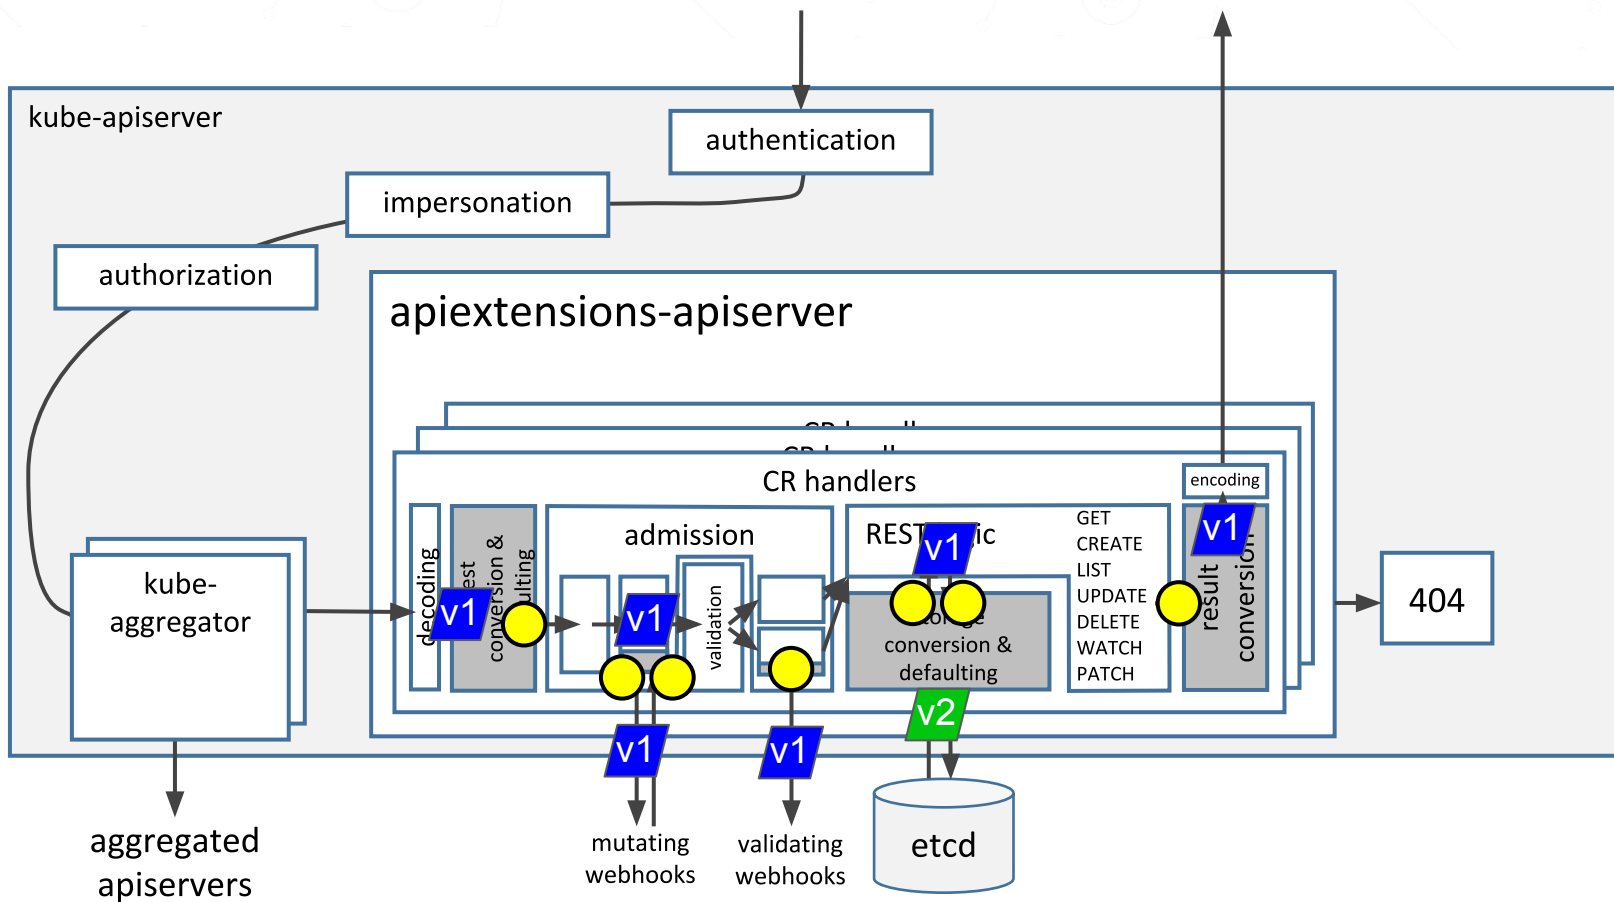

- Since 1.13 as alpha: Webhook Conversion
 - similar to admission webhooks, via `apiextensions.k8s.io/v1beta.ConversionReview`

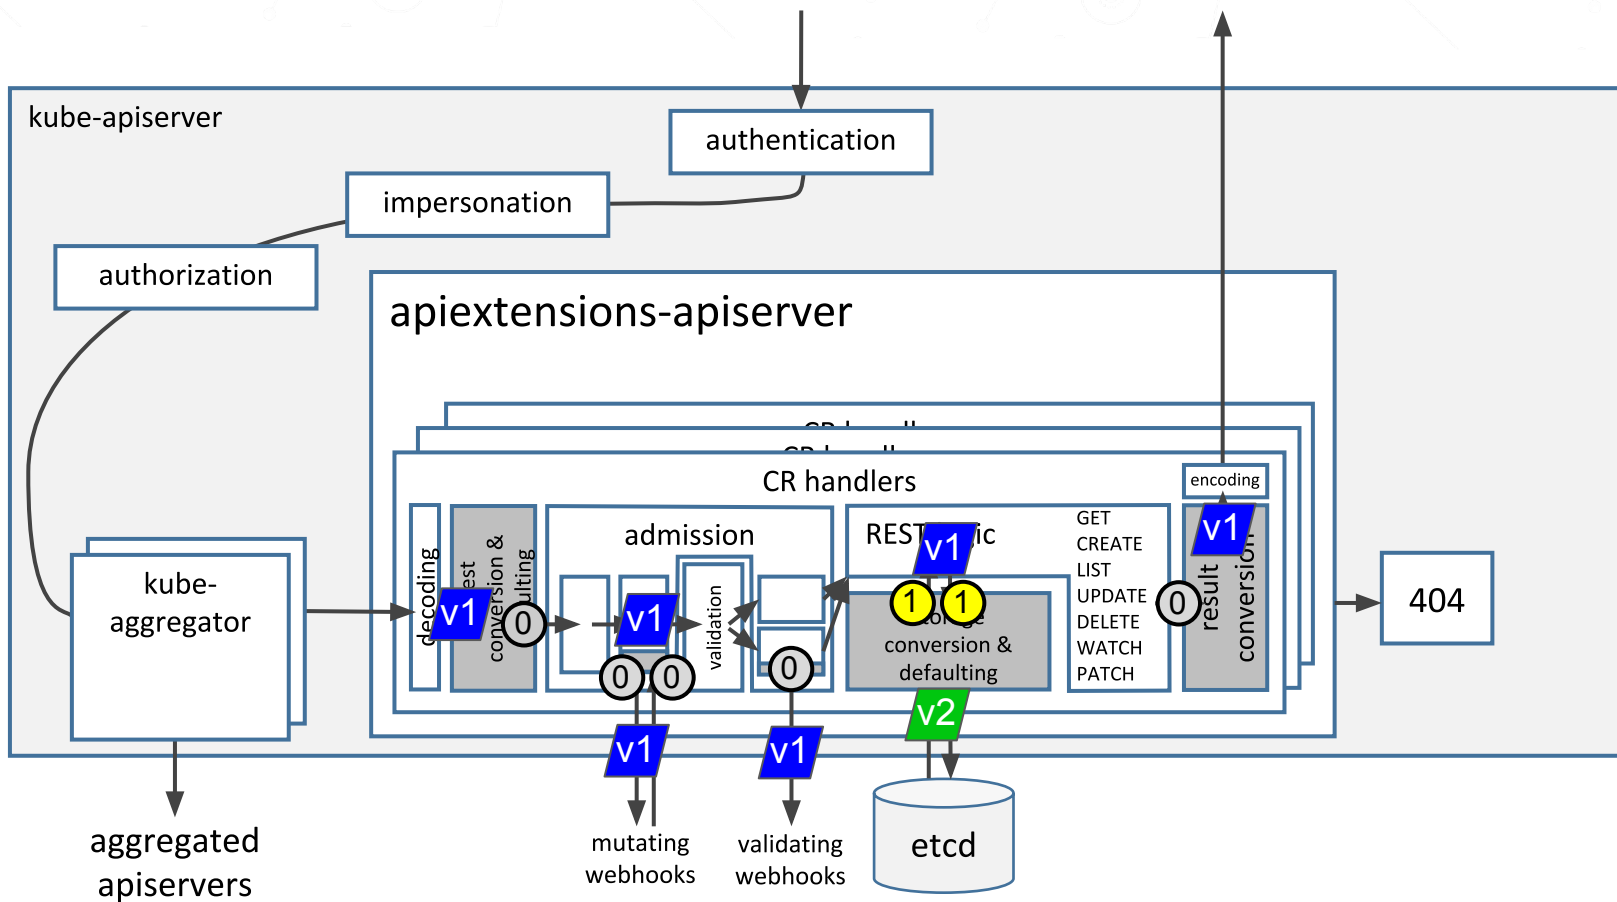

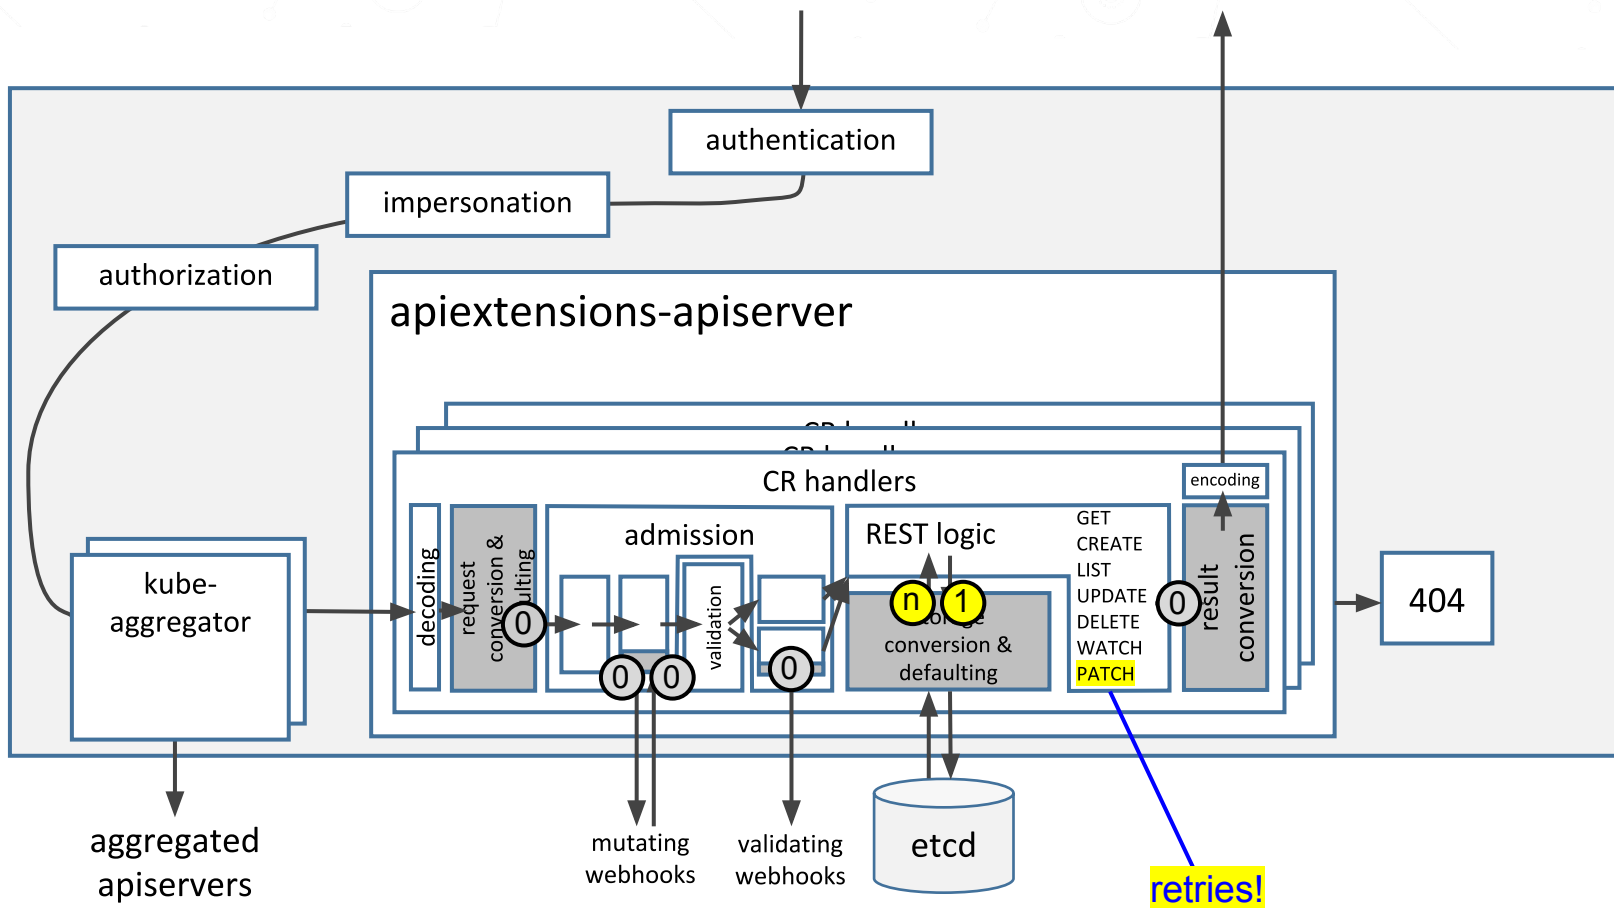

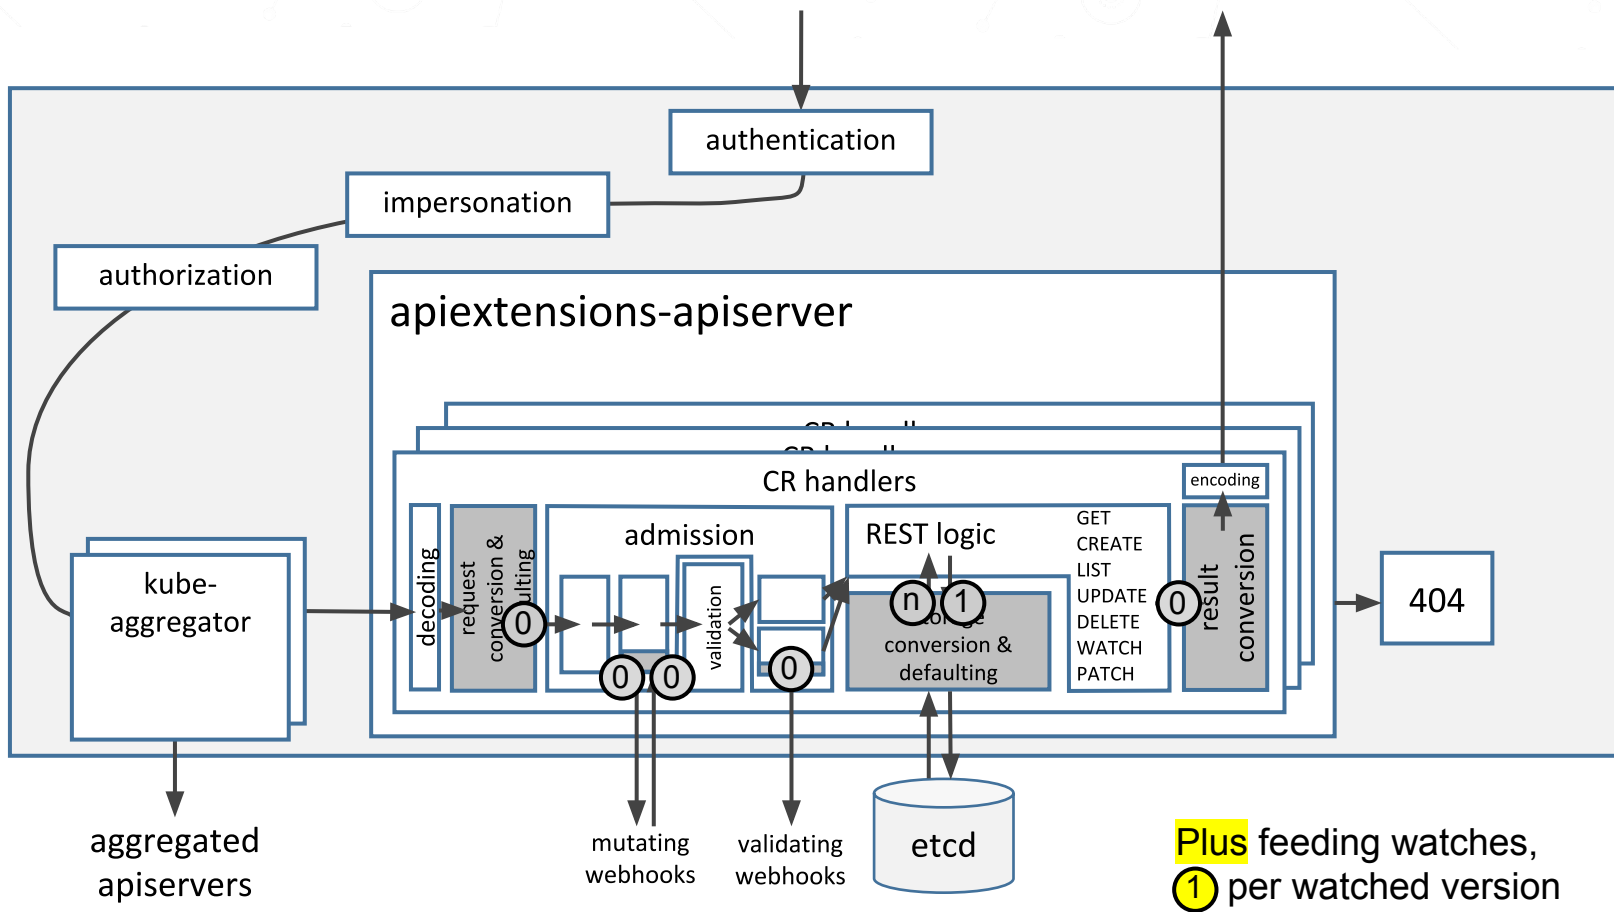

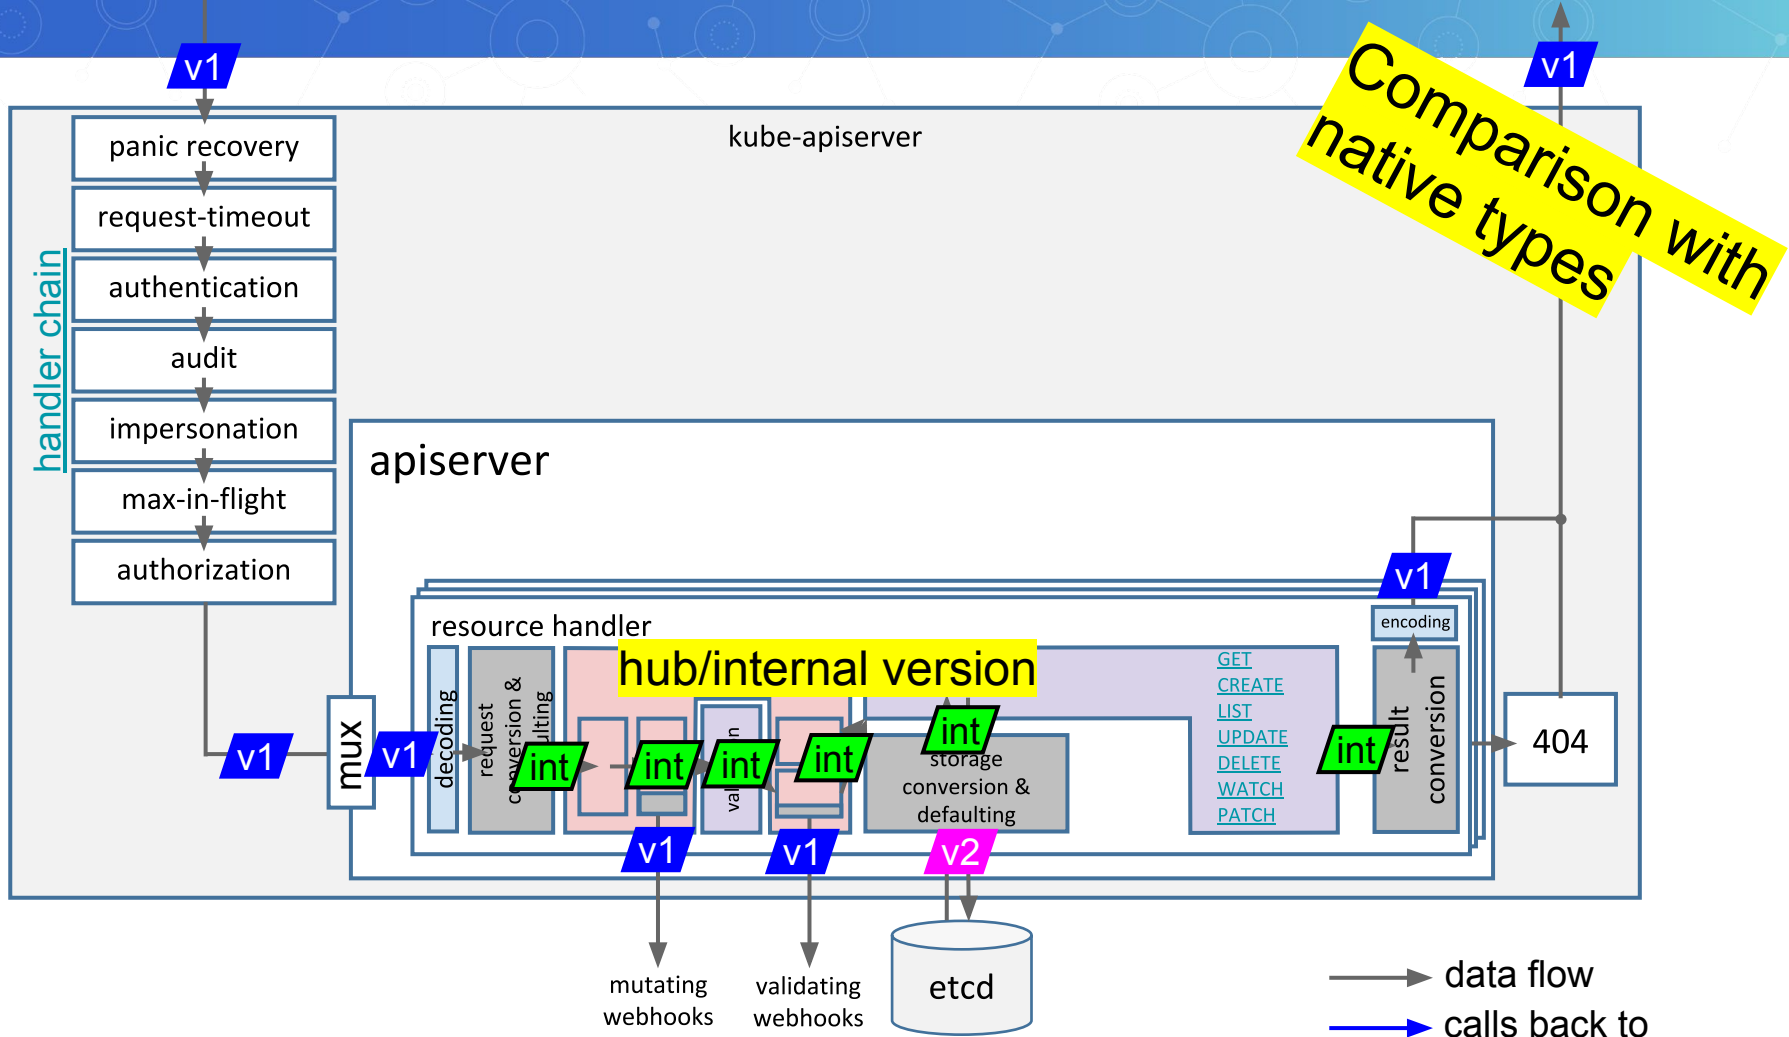

Plus feeding watches,
① per watched version

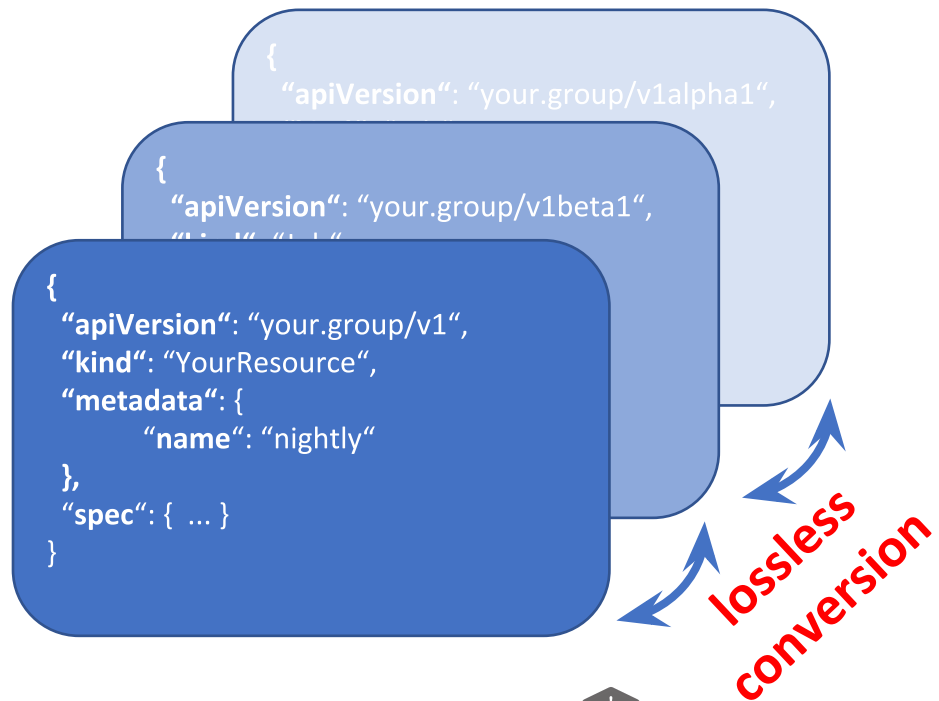

Roundtrip'ability

getting lossless conversion right is hard
established test pattern:

roundtrip test between all versions:

1. take YourResource e.g. in v1
2. fill with random values ("fuzzing")
3. convert to e.g. v1beta1
4. convert back to v1
5. compare result with original
6. repeat

Example: k8s.io/sample-apiserver/blob/master/pkg/apis/wardle/install/roundtrip_test.go

Roundtrip testing – how we do that in upstream

use the **gofuzz** library + k8s.io/apimachinery/pkg/api/apitest/roundtrip:

```
func Funcs(codecs runtimeserializer.CodecFactory) []interface{} {  
    return []interface{}{  
        func(e *audit.Event, c fuzz.Continue) {  
            c.FuzzNoCustom(e)  
            doAuditEventDefaulting()  
            enforceAnyOtherTypeInvariant()  
        }  
    }  
}  
  
func TestRoundTrip(t *testing.T) {  
    roundtrip.RoundTripTestForAPIGroup(t, Install, fuzzer.Funcs)  
}
```

Example: [pkg/apis/audit/fuzzer/fuzzer.go](https://k8s.io/apimachinery/pkg/api/apitest/roundtrip_test.go) & [pkg/apis/audit/install/roundtrip_test.go](https://k8s.io/apimachinery/pkg/api/apitest/roundtrip_test.go):

CRD – Outlook for 2019 and beyond

Outlook for 2019 and beyond

- **critical issues** identified for moving **CRDs to GA** (issue [#58682](#)):
 - **generate OpenAPI** spec from validation schema
➔ kubectl-side validation, kubectl explain
 - **quota** support
 - **defaulting** and **pruning**
 - ... a number of smaller topics
- Other open, undecided topics:
 - validation schema language: alternative language, OpenAPI references, Go-types to schema
 - graceful deletion
 - validation webhook
 - arbitrary field selectors
 - protobuf encoding
 - namespace-local CRDs

The other big 2019 theme:
Server-side Apply

Serverside Apply

- Plumbing: mostly done
- Pivot!
 - From $x = a + (b - c)$ to field “managers”
- Low level operations: mostly done
- API: in progress!
 - Looks to be a big improvement over the old last-applied annotation
 - Shorter
 - Omits values
- Alpha in 1.14
- Next steps
 - Perfect place to check general schema concerns (e.g, add discriminated unions)

API Machinery Q & A
